

1. A binary sequence which satisfies Golomb's randomness postulates is called a pseudo-noise sequence or a pn-sequence. Consider the periodic sequence $s = 011001000111101$ of period $n = 15$. Is this sequence pn-sequence? Justify your answer.
2. The so called S-box (Substitution box) is widely used cryptographic primitive in symmetric-key cryptosystems. In AES (Advanced Encryption Standard) the 16 S-boxes in each round are identical. All these S-boxes implement the inverse function in the Galois Field $GF(2^8)$, which can also be seen as a mapping, $S : \{0, 1\}^8 \rightarrow \{0, 1\}^8$, so that $x \in GF(2^8) \rightarrow x^{-1} \in GF(2^8)$ i.e. that is 8 input bits are mapped to 8 output bits. What is the total number of possible mappings one can specify for function S ?
3. In cryptography and computer security, man-in-the-middle attack (MITM), is an attack where the attacker secretly relays and possibly alters the communications between two parties who believe that they are directly communicating with each other.
 - (i) Describe how a man-in-the-middle attack may be performed on a Wi-Fi network and the consequences of such an attack.
 - (ii) Explain how a man-in-the-middle attack on a Wi-Fi network can be defeated.
4. Consider a plaintext of size 1024 bits, has a probability of 0.7 for producing a 0 and the LFSR sequence has about 60% 0's. Find the approximate number of 0's in the resulting cipher.
5. Show that any m -sequence is G-random.
6. Prove that out-of- phase autocorrelation function of an m -sequence with period $2^n - 1$ is $\frac{-1}{2^n - 1}$.
7. Suppose we wish to construct an m -sequence of length 31. Using polynomial 45 (in octal). Write the resulting m -sequence by LFSR with initial sequence (1, 0, 0, 0, 0).
8. Let s be a periodic binary sequence with period p . Let k be the number of entries 1 in one period of s and μ is the number of pairs $(s_i, s_{i+\tau}) = (1, 1)$ for a fixed $\tau < p$, $0 \leq i \leq p$. Then prove that the autocorrelation coefficients $C(\tau)$ is

$$C(\tau) = 1 - \frac{4(k - \mu)}{p}$$

9. An affine block cipher is one where the key specifies a non-singular 3 by 3 matrix \mathbf{A} and an 3-tuple \mathbf{t} to define the affine transformation $\mathbf{c} = \mathbf{A}\mathbf{m} + \mathbf{t}$ where , \mathbf{m} is a block of plaintext (size s) and \mathbf{c} is the corresponding ciphertext. \mathbf{c} , \mathbf{A} and \mathbf{m} all are over $\text{GF}(2)$. Find the number of affine block ciphers.
10. Each of the following points has finite order on the given elliptic curve over \mathbb{Q} . In each case, find the order of P .
- (a) $P = (0, 16)$ on $y^2 = x^3 + 256$
 - (b) $P = (1/2, 1/2)$ on $y^2 = x^3 + (1/4)x$
 - (c) $P = (3, 8)$ on $y^2 = x^3 - 43x + 166$
 - (d) $P = (0, 0)$ on $y^2 + y = x^3 - x^2$
11. Consider elliptic curve over F_{2^4} (field of characteristic 2) is
- $$E: y^2 + xy = x^3 + g^4x^2 + 1,$$
- where $g = (0010)$ is generator of F_{2^4} . F_{2^4} is constructed using primitive polynomial $f(x) = x^4 + x + 1$. List all the elements in $E(F_{2^4})$.
